【Note1】

If users use the product out off the environmemt operation range（temperature and humidity）,it will concern for visual quality.

【Note2】

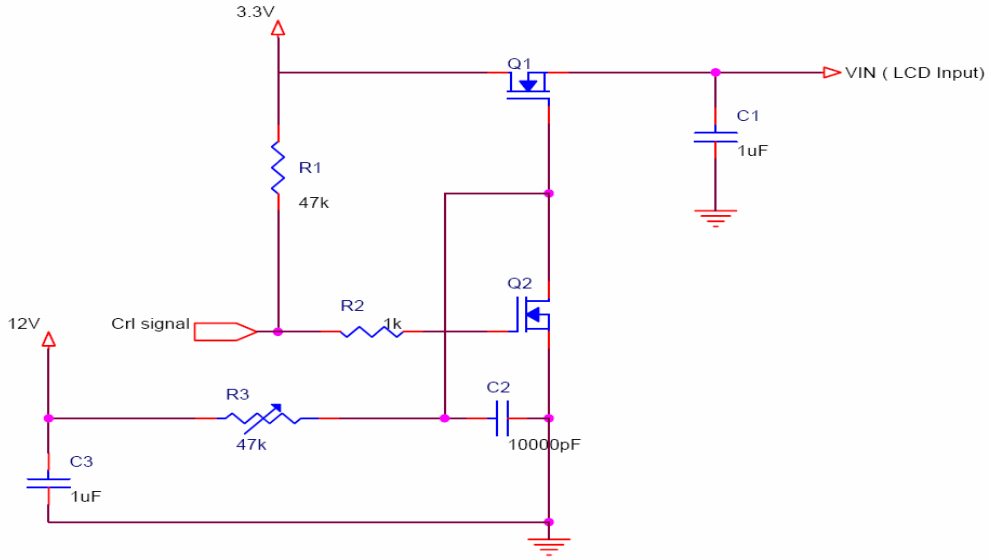
Test Condition: IEC 61000-4-2 ,

VESDc ：Contact discharge to input connector

VESDm：Discontact discharge to module

【Note3】

The input pulse-current measurement system as below：



Control signal:High(+3.3V)→Low(GND)
Supply Voltage of rising time should be from R3 and C2 tune to 550 us.

【Note 4】
Table of specifications are definition of single lamp .
【Note 5】
The frequency is operated in the range, will not influence the life of lamp and display characteristic.
【Note 6】
The time needed to start discharge when the over Starting Lamp Voltage is continuously applied to both ends of the lamp. Before testing, the lamp is left in the dark room (ambient temperature : 25±2℃, ambient illuminance : less than 0.1lux) for 24Hr after lighted for 1 minute at rated lamp current. The testing shall be conducted in the dark room. And the sealing side shall be connected to high voltage side. (ambient temperature :25±2℃, ambient illuminance : less than 0.1lux). The minimum safety time for the inverter need over the maximum time for the start discharge .

If the driving waveform of lamp is asymmetric, the distribution of mercury inside the lamp tube will become unequally or will deplete the Ar gas in it. Then it may cause the abnormal phenomenon of lighting-up. Therefore, designers have to try their best to for fill the conditions under the inverter designing-stage as below:

- ⌘ The degrees of unbalance： ＜10 %
- ⌘ The ratio of wave height：＜√2 ±10 %

[Note]

*1) Table of specifications are definition of single lamp.

*2) 1.Frequency in this range , the characterisitics of electric and optics can maintain in ±10% except hues.
2.Lamp frequency of inverter may produce interference with horizontal synchronous frequency (or vertical synchronous frequency),and this may cause ripple noise on the display. Therefore, please adjust inverter frequency, and keep inverter as far from module as possible or use electronic shielding between inverter and module to avoid the interference.

*3)1.Starting Lamp Voltage: Vs = initial value Vs
2.Definition of starting lamp voltage means max. voltage of starting lamp. We suggest the inverter starting voltage greater then max. voltage of starting lamp to certify starting lamp stability.

*4) Definition of the lamp life time：Luminance(L) under 50% of specification starting lamp voltage.

*5) Test condition of Turn on and off life : Turn on and off lamp at IL=8.0mA and (Ta=25 ±5℃). The frequency is 10 sec.(on)on/ 10 sec. (off) and go on 100,000 times repeatedly.
